That the loathsome and most dreaded disease, the smallpox, is making rapid headway in this city is no longer a matter of doubt or speculation, and the health authorities fully recognize the fact by the bold and active measures.

Instituted to suppress the further growth of the pestilence, if possible. From week to week, for some months past, the virus has gone on increasing, until it has reached to alarming figures, as shown in the report issued yesterday by the Board of Health. When first the smallpox made its appearance this winter the city was in a most unfortunate condition to meet an epidemic of that terrible nature. Then the authorities were compelled to look on and see the destroyer do its deadly work without being able, to any great extent, to check its progress. In consequence of this inability of the Board of Health to meet a flood of pestilence like that which broke upon New York, the disease secured a firm hold in the thickly populated districts before the authorities were put into a proper position to battle with it for the lives and safety of the people. The principal difficulty in the way of preserving the population against this calamity was

THE WANT OF MONEY. The Board of Health had none, and the city coffers, to which they were compelled to turn for assistance, were in a similar condition. The Commissioner sympathized deeply with the embarrassed Board, but (under assistance he was unable to give them. After some time, however, sufficient means were obtained to enable the Board to do something towards the preservation of the public health, and the light with the pestilence began. A number of medical men were engaged to go about the city and visit every house for the purpose of vaccinating the inmates free of charge, and by this means make them impregnable to smallpox. Thus, after long experience, the Board of Health have found to be the most efficacious means of securing the people against the attacks of the pestilence. In some districts this plan worked well, but in others, either through the stubbornness of the people or their aversion to medical treatment, the disease went on increasing. According to the official records in the Bureau of the City Sanitary Inspector the German population are the most difficult to deal with. They persistently refuse to be vaccinated, and resist every effort of the sanitary corps to put them in a state to meet the pestilence that is now

DEVOURING THE CITY. Although the disease has extended over the entire surface of New York, and is not specially located to any extent or in any district, yet the returns of smallpox cases on the books of the Health Department show that a large preponderance of the afflicted are Germans.

At the regular meeting of the Board of Health yesterday the City Sanitary Inspector presented a lengthy and comprehensive report on the subject, in which is shown the state of smallpox in all the principal cities of the world, and the results arrived at in New York by the work of the Health Department. The treatment of the disease was discussed, as well as the manner of preventing and pointing out the virus. There are subjects exceedingly important to the public at large and to a great portion of the medical faculty, among whom a very wide difference of opinion exists as to the various methods of treatment, prevention and cure in use. In fact, it has been ascertained without a doubt that methods of vaccination differ as much almost as the characters of the men who hold diplomas. Under such a state of things it is of the first importance that the people should be thoroughly instructed on the subject at moments like the present, when

THE AIR IS TEEMING WITH DEATH. The smallpox Hospital is an institution that year after year makes its appearance before the public in an unenviable light. It is now ascertained from the report of the City Sanitary Inspector that a large number of patients was sent there last year who did not belong to the city or county of New York or who had not been transmitted from Quarantine. To find out whether these persons have been paupers who were admitted to the hospital and cared for by the city, or paid for the accommodation extended to them, the Board of Health is about to institute an inquiry. This hospital is under the control of the Commissioners of Charities and Correction, who are never responsible for anything, when it should really be under the direction of the Board of Health. The whole subject of the Smallpox Hospital is now under consideration, and a report upon the vexed question will soon be laid before the public, from which they will be able to judge of the style in which

THE ADMIRABLE DEED IS MANAGED. On the suggestion of Commissioner Mott in the meeting of the Board of Health yesterday the advisability of stationing a number of inspectors at the principal ferries and railroad depots leading from New York to Jersey is to be taken into consideration. This, the Commissioner pointed out, was absolutely necessary, as Jersey is teeming with smallpox, and there can be no doubt it is brought to this city every day by the railroads and ferries. This has been shown conclusively by the reports of the City Sanitary Inspector, and the Board intend to adopt some decisive steps to put a stop to it in the present state of affairs.

DISEASES ALL OVER THE COUNTRY, and more especially in the cities immediately surrounding New York. It is absolutely necessary to take measures that will in some degree mitigate the threatened evil. Brooklyn is in an alarming condition; Jersey is even worse, and Philadelphia has been known to be in a most deplorable condition. The means by which the disease is transmitted are so varied that no positive rules can be laid down for the direction of the public. But one fruitful source of this and other diseases is the street car. Dr. Stephen Smith said yesterday they are full of vermin of the most loathsome and disgusting kind, and a general channel of pestilence in the city. The Third Avenue and the "Cross-town" or Thirty-fourth Street lines are mentioned as being particularly filthy and dangerous to health.

THE SANITARY INSPECTOR'S REPORT. The following is the report submitted by the City Sanitary Inspector for the information of the Board:

During the past three years the smallpox has shown

an epidemic form in various parts of the civilized world. Notwithstanding the efforts of the health authorities in the various localities where it has prevailed to arrest its progress, it still continues to find large numbers of unprotected victims. The general apathy prevalent among people of different nationalities, induced by long exemption from any great epidemic of this disease, has produced an indifference to the disease, and a consequent neglect of the use of the only sure preventive which has proved worthy of the name.

The gradual scepticism which, from various causes, has been growing in the public mind with reference to the absolute protective value of vaccination, has produced a corresponding indifference in many places to its almost total abandonment, and, consequently, we are now becoming aware of an enormous increase in the number of victims annually destroyed or disfigured by this loathsome pestilence.

In the large cities of the Eastern Continent, in South America, in the Pacific, the Indian and Atlantic Oceans and North American cities, it has shown a constantly increasing tendency to assume large proportions during the last three years. The following figures show the death records of the year 1871, some of these facts. The following is a statement of the

DEATHS BY SMALLPOX during the first nine months of the year 1871 in various places, with the population of each in round numbers, and the percentage of the total population. (It may safely be estimated that the deaths indicate about one-fourth of the total number of cases occurring.)

| | Population. | No. Deaths. | Per Cent. |
|--------------------|-------------|-------------|-----------|
| Berlin..... | 900,000 | 3,171 | 3.52 |
| London..... | 2,200,000 | 1,891 | 3.62 |
| Liverpool..... | 525,000 | 210 | 4.00 |
| Manchester..... | 380,000 | 210 | 4.00 |
| Glasgow..... | 600,000 | 210 | 4.00 |
| Newcastle..... | 120,000 | 601 | 5.01 |
| South Holland..... | 100,000 | 601 | 6.01 |
| San Francisco..... | 100,000 | 601 | 6.01 |
| New York..... | 1,000,000 | 601 | 6.01 |

These figures show that while this disease has, during the past year, swept away its thousands in other cities New York has a death record of only 800 out of a population of 1,000,000—a percentage of .80 per cent. of the population.

In the exhibition of this favorable work New York may claim to have done better than any other city has ever done. Notwithstanding the well known fact that it is more directly exposed to the inroads of this and other

EPIDEMIC PESTILENCES, being the great outlet of emigration, the grand gateway of the high seas, and the great thoroughfare of the air, to all other parts of the world, from which the disease may be transported during periods of pestilence, yet, by the use of such means as science and experience have shown to be effective in prevention and arresting its spread, has New York

THIS WIDELY DESTRUCTIVE PESTILENCE. It may be said, without fear of contradiction, that the history of the city of New York, from its early settlement, has been a history of systematic and successful measures to suppress the further growth of the pestilence, if possible. That the loathsome and most dreaded disease, the smallpox, is making rapid headway in this city is no longer a matter of doubt or speculation, and the health authorities fully recognize the fact by the bold and active measures.

Instituted to suppress the further growth of the pestilence, if possible. From week to week, for some months past, the virus has gone on increasing, until it has reached to alarming figures, as shown in the report issued yesterday by the Board of Health. When first the smallpox made its appearance this winter the city was in
